Conor Brown

Staff Software Engineer · C#/.NET · Architecture & Platform Engineering

Oklahoma, USA · carllbrown87@gmail.com · LinkedIn · GitHub

PROFESSIONAL SUMMARY

Staff-level software engineer with 12+ years of .NET experience who sets technical direction across teams, not just within one. Owns architecture for legacy modernization, domain-driven design adoption, cloud migration paths, and the engineering standards other engineers build against. Has delivered platform-scale systems (remote management across 2,000+ servers, billing telemetry under a 99.9% delivery SLA) and cut delivery-pipeline times by more than half. Multiplies the output of a 10-developer team through architecture reviews, design workshops, mentoring, and clear standards for validating AI-assisted code. Works across C#/ASP.NET Core, SQL Server, and Azure.

SELECTED IMPACT

- Architecture and modernization: Led the move of a legacy .NET Framework MVC application to .NET 10, and defined a coordinated path to Azure App Service covering runtime configuration, Entra integration, Key Vault identity, parallel pipelines, staging validation, and rollback planning.
- Domain-driven design adoption: Led event-storming and DDD sessions that made business rules and ownership explicit, then carried the model through aggregates, APIs, persistence, UI, and end-to-end tests in a DDD/CQRS workflow and rule-builder capability.
- Testing strategy: Drove the decision to keep end-to-end tests in the application repository rather than a separate test project, which cut overhead and complexity and kept tests from going stale as the application changed.
- Engineering standards: Wrote the CLAUDE.md reference guide covering DDD, dependency boundaries, modern C#, and a reference vertical slice; reinforced it through code reviews and workshops.
- Delivery performance: Reduced CI/CD duration from roughly 40–60 minutes to 19 minutes, and core test execution from 8–9 minutes to approximately 21 seconds, through coverage-tooling changes.
- Business-critical platform work: Designed an Azure Service Bus usage-logging platform around a 99.9% delivery SLA; it fed billing and revenue for the whole company and its enterprise customers. Also built remote management infrastructure serving 2,000+ servers.
- Technical leadership: Guide a team of 10 developers through design decisions, architecture reviews, and workshops; supported a product-line transition spanning catalog identity, component modeling, pricing, drawings, indexing, and admin tooling.

PROFESSIONAL EXPERIENCE

MIRATECH — April 2025–Present

Software Developer III · Architecture and platform leadership responsibilities

- Set the technical direction for modernizing a legacy .NET Framework MVC application to .NET 10, with C#/ASP.NET Core Web APIs and React/TypeScript interfaces on SQL Server.
- Led event-storming and DDD implementation sessions, and designed the DDD/CQRS workflow and rule-builder capabilities across aggregates, APIs, persistence, UI, and end-to-end testing.
- Led a coordinated modernization path toward Azure App Service: runtime configuration, Entra integration, Key Vault identity, parallel pipelines, staging validation, and rollback planning.
- Guide a team of 10 developers through design decisions, architecture reviews, and code reviews, and drove the decision to keep end-to-end tests in the repository instead of a separate suite; codified standards in a CLAUDE.md reference guide with a reference vertical slice.
- Modernized CI/CD and test workflows, including Playwright-based regression coverage, cutting pipeline time from 40–60 minutes to 19 minutes.

- Supported a product-line transition involving catalog identity, component modeling, pricing, drawings, indexing, and administrative tooling.
- Uses Claude Code for implementation, refactoring, testing, and legacy-code work, validating changes against domain rules, architecture boundaries, tests, and review. Also built Mega Desk, an internal agent harness (Claude Agent SDK, Codex CLI, Azure DevOps) that teammates use daily.

IXOPAY June 2021–April 2025
Senior Software Engineer

- Built payment-related microservices including a containerized Card Account Updater to address subscription churn caused by expiring payment credentials.
- Engineered asynchronous API usage telemetry with Azure Service Bus and a 99.9% delivery SLA for billing-related data; the SLA covered billing and revenue for the whole company and its enterprise customers.
- Introduced integration-test infrastructure and secure runtime configuration patterns across cloud services.

MissGroup / Hostek January 2014–June 2021
Software Engineer

- Rebuilt web-hosting management workflows with .NET Web APIs, React, and an orchestration/gateway layer.
- Designed remote infrastructure and deployment tooling operating across 2,000+ Windows servers, including IIS, firewall, certificate, and service management.
- Built secure credential management and remote access functionality supporting controlled sharing.

TECHNICAL BREADTH

Backend and architecture: C#, .NET Framework and .NET 10, ASP.NET Core / Web API, MVC, Entity Framework Core, DDD, CQRS, Clean Architecture, event-driven design, event storming, microservices and modular monoliths, legacy modernization.
Cloud and platform: Azure App Service, Azure Service Bus, Key Vault, App Configuration, Docker, Azure DevOps, GitHub Actions, observability.
Product and data: Blazor WASM, React, TypeScript, React Native/Expo, SQL Server, PostgreSQL, MySQL, MongoDB, Cosmos DB, query/index tuning, Playwright, xUnit, NUnit, and integration testing.
AI development: Claude Code, Claude Agent SDK, Codex CLI, custom agent tooling, CLAUDE.md context conventions, agent workflows, prompt context, code review and validation.
